

Join the toilet revolution! Be one of the first to experience a high performance toilet requiring only 1.5 litres of water per flush. Propelair is a reliable innovation, offering customers a green and cost efficient solution compared to conventional WC systems.

After 5 years of intensive research and development, the British designed and manufactured invention uses patented POWA displaced air technology, which creates a powerful high performance flush.

The water efficient innovation reduces water consumption by 84% compared to the average UK toilet. This means it's great for your budget! With toilet flushing accounting for up to 90% of all water use in commercial buildings and offices, quick payback periods can be achieved, typically averaging between 6 months and 3 years, with water bills slashed by up to 60%.

The super-clean toilet also improves sanitary hygiene. Research carried out by The Centre for Research into Environment and Health confirmed almost all aerosol and residual contamination is removed upon flushing. The rimless pan and patented removable hinge system, with its smooth contours, make previously hard-to-clean areas easily accessible, ensuring all contaminants are removed. Reducing the risk of cross contamination means a cleaner, healthier environment for your workforce.

Due to its unique design, Propelair can be easily retrofitted to existing drainage systems and

can operate using small-bore drains in addition to the usual 100mm size. This is a significant advantage for designers and architects allowing total design freedom when deciding toilet positioning.

Reaching the highest performance rating under BREEAM's water efficiency consumption guidelines, whilst boasting WRAS, ISO9001, BSI Kitemark and Waterwise approval, Propelair is an innovation you can trust.

So why not join the green toilet revolution and benefit from Propelair's innovative design, style and functionality.
