

Environmental monitoring specialist, enitial (UK), has been selected as a preferred partner of the National Laboratory Service (NLS) to provide a comprehensive environmental sampling, monitoring and analysis service.

The framework of suppliers, which has been set up by NLS to help meet the demands of its growing commercial portfolio, includes four providers of sample and field based services, one of which is enitial.

Ivor Parry, business development director at enitial said: “enitial is always striving to provide a high quality service and has worked with the National Laboratory Service (NLS) previously to provide a sampling service that is second to none. Being chosen as a preferred partner is testament to the unrivalled level of sampling and field based services we offer.”

Karen McKenzie Fawcett, head of commercial at the National Laboratory Service (NLS), added: “NLS prides itself on being a centre of excellence for environmental analysis so it is essential that our partners aspire to the same level of quality. NLS already has a strong delivery relationship with enitial working for clients such as Severn Trent Water. We look forward to working on more projects with them as our commercial laboratory services grow.”

The framework of preferred suppliers will support the NLS’ commercial activities to help meet the demands of a growing commercial portfolio. When a relevant opportunity arises, enitial will form part of the tender team to provide a competitive bid. If successful, enitial will manage, collect and report on samples which will then be analysed by NLS.
